Bitspower Summit M Pro CPU Water Block series

Bitpower Launches Summit M Pro CPU Water Block

Bitpower, one of the world's leading suppliers of water-cooling equipment for performance computers, has unveiled its most powerful and high-performance water block for Intel and AMD CPUs: the Summit M Pro. The Summit M Pro is a highly efficient water-cooling solution that's compatible with the latest CPUs from the two major manufacturers, including Intel's 12th-gen Alder Lake processors.

The water block brings major upgrades in performance due to its expanded cooling liquid capacity, along with increasing the heat dissipation effect on the CPU's core. These features help to substantially boost heat transfer, ensuring optimal cooling for some of the most powerful processors on the market today.

To further improve heat dissipation, the water block features a base plate made from highly conductive copper, while its water injection system has been optimised to allow for high flows of coolant.

The Bitpower Summit M Pro includes brackets and accessories for Intel's 12th-gen CPUs, while AMD brackets and accessories will be made available once the company's latest CPU hits the market. Want serious cooling for your CPU? Look no further than the Bitpower Summit M Pro.
